Prez Sez By Beverly House

Greetings all. Happy June!

Happy Birthday to all our members born in and a Happy Father's Day to all of our Rock Dads.

New Members:

I personally want to welcome all the new members we have had sign up this year. Hopefully, as we see things opening up with the state, we will be able to resume field trips in the near future.

New dinosaur species discovered in Australia One of world's biggest

SYDNEY (Reuters) - Scientists have confirmed the discovery of a new dinosaur species in Australia, one of the largest found in the world, more than a decade after cattle farmers first uncovered bones of the animal.

The plant-eating sauropod lived in the Cretaceous period between 92 million and 96 million years ago when Australia was attached to Antarctica, according to a research paper <https://peerj.com/articles/11317> published on Monday.

Paleontologists estimated the dinosaur reached a height of 5-6.5 metres at the hip and 25-30 metres in length, making it as long as a

basketball court and as tall as a two storey building.

That makes the new species the largest dinosaur ever found in Australia and puts it in the top five in the world, joining an elite group of titanosaurs previously only discovered in South

America.

"Discoveries like this are just the tip of the iceberg," said Queensland Museum curator and palaeontologist Scott Hocknull.

Tar Heel Gem and Mineral Club, Inc. - May Meeting Minutes

Tuesday, May 18, 2021

While there was a meeting in May, there were no minutes, since the secretary did not attend the meeting.

Respectfully Submitted
 Cyndy Hummel,
 Secretary, Tar Heel Gem and Mineral Club, Inc.

Tar Heel Gem and Mineral Club, Inc. - June Meeting Information

The Tar Heel Gem and Mineral Club is inviting you to a scheduled Zoom meeting for the June Monthly Meeting.

We look forward to "seeing" everyone there. If you experience any issues getting into the meeting, you can call or text me at (919) 389-1821. Thanks,

Topic: Tar Heel Gem and Mineral Club June 2021 Monthly Meeting
 Time: June 15, 2021 7:30 pm - 8:30 pm

Field trips:

Other Quarry Field trips: We still do not have any dates to share-but as they open back up, I will share that information asap! We appreciate the kindness of the quarries for their continued support of field trips and totally understand the

issues they face, especially their concerns of possible exposure to their employees.

A quick note: Field trip notifications are made through emails, which are sent through emails to all current and non-current members. If your email is incorrect in our records, you may be missing important information about upcoming events.

Please feel free to contact me via email, text, or phone or if you have any questions or concerns.

Thank you all for either being a member of THGMC or your interest in our club-and as always ROCK ON!

New dinosaur species discovered in Australia

Continued from Page 1

Paleontologists have named the sauropod "Australotitan cooperensis", combining "southern titan" with the name of a creek near where the first of the creature's bones were found in 2006 on a cattle farming property in Eromanga in Queensland state.

The confirmation of the new species marks a seventeen-year long journey to first unearth and then compare the bones of "Cooper", as the dinosaur is more informally known, to other finds.

Dinosaur bones are enormous, heavy and fragile, and are kept in museums around the world, making scientific study difficult.

The team from the Eromanga Natural History Museum and the Queensland Museum used new digital technology for the first time to 3-D scan each bone for comparisons.

"To make sure Australotitan was a different species, we needed to compare its bones to the bones of other species from Queensland and globally," Hocknull said. "This was a very long and painstaking task."

Robyn Mackenzie, who was mustering cattle with her husband Stuart on their property when they discovered the bones, founded the Eromanga Natural History Museum to house the find.

A swath of further discoveries of dinosaur skeletons in the area, along with a rock-shelf believed to have been

a sauropod pathway, are still awaiting full scientific study.

"Palaeo Tourism has been huge globally so we're expecting a lot of international interest when our borders re-open," said Mackenzie, now a field paleontologist.

Hocknull said even larger dinosaur specimens are waiting to be discovered, given the plant-eating sauropods were generally preyed on by huge theropods.

"We've found a couple of small theropod dinosaurs in Australia ... but it wouldn't have bothered Australotitan, which suggests there is a very large predatory dinosaur out there somewhere. We just haven't found it yet."

Moonstone Birthstone

Moonstone Birthstone Meaning & History

Moonstone is the best-known gem of the feldspar group of minerals. It is renowned for its adularescence, the light that appears to billow across a gemstone, giving it a special glow. The finest moonstones show a blue sheen against a colorless background. This June birthstone has been associated with both the Roman and Greek lunar deities. Hindu mythology claims that it is made of solidified moonbeams. Moonstone is often associated with love, passion and fertility; it is believed to bring great luck.

Great designers of the Art Nouveau era (1890s–1910s), such as René Lalique and Louis Comfort Tiffany, featured moonstone in their fine jewelry. The moonstone birthstone came to the forefront again during the 1960s “flower child” movement and with New Age designers of the 1990s.

Where Is Moonstone Found?

Moonstone can be found in a wide variety of places. This includes parts of the United States, such as New Mexico, North Carolina and Virginia. The most important world locations for the moonstone birthstone are India and Sri Lanka, but sources also include Brazil, India, Sri Lanka, Madagascar, Myanmar and Tanzania.

Moonstone Birthstone Care & Cleaning

Moonstone is a 6–6.5 on the Mohs scale of hardness and has poor toughness. It may crack when exposed to high heat. Therefore, ultrasonic and steam cleaners should not be used on your moonstone. The best option for cleaning is warm, soapy water with a soft brush.

Moonstone

Moonstone is a sodium potassium aluminium silicate ((Na,K)AlSi₃O₈) of the feldspar group that displays a pearly and opalescent schiller. An alternative name is hecatolite.

Etymology

Its name is derived from a visual effect, sheen or schiller (adularescence), caused by light diffraction within a micro-structure consisting of regular exsolution layers (lamellae) of different alkali feldspars (orthoclase and sodium-rich plagioclase).

History

Moonstone has been used in jewelry for millennia, including ancient civilizations. The Romans admired moonstone, as they believed it was derived from solidified rays of the Moon. Both the Romans and Greeks associated moonstone with their lunar deities. In more recent history, moonstone became popular during the Art Nouveau period; French goldsmith René Lalique and many others created a large quantity of jewelry using this stone.

Geology

The most common moonstone is of the orthoclase feldspar mineral adularia, named for an early mining site near Mt. Adular in Switzerland, now the town of St. Gotthard. A solid solution of the plagioclase feldspar oligoclase +/? the potassium feldspar orthoclase also produces moonstone specimens.

Occurrence

Deposits of moonstone occur in Armenia (mainly from Lake Sevan), Australia, the Austrian Alps, Mexico, Madagascar, Myanmar, Norway, Poland, India, Sri Lanka and the United States.

In Popular Culture

The moonstone is the Florida State Gemstone; it was designated as such in 1970 to commemorate the Moon landings, which took off from Kennedy Space Center. Despite it being the Florida State Gemstone, it does not naturally occur in the state.

Moonstone or moonstone gems have been used frequently in many supernatural applications, particularly in pop culture, such as in *The Vampire Diaries*. Most often in stories about supernatural vampires or werewolves, moonstones have been shown either enhancing or suppressing the abilities of supernatural creatures.

About Our Organization...

The Tar Heel Gem and Mineral Club, Inc. was formed in 1974 as a nonprofit educational organization for people who enjoy the lapidary arts, earth sciences, and related subjects. The main objectives of the club are to investigate, preserve, and share knowledge of rocks, minerals, and precious stones, and to promote interest in mineralogy, paleontology, earth sciences, and lapidary techniques, among club members and among the general public. The club pursues these goals through publications, meetings, lectures, field trips, exhibits, demonstrations, and other activities.

Come and be a part of the Fun!
